

Gtechniq **g1 Wiper** **Proof Glass Nano Coat**

Nanotech

Lotus Effect

Easy Clean

Long Lasting

g1 is a non smearing rain repellent glass coating with excellent durability. A single coating will last approximately 30k miles. This coating makes wet weather driving less tiring and safer through greatly enhanced visibility. g1 helps to repel dirt and makes glass easier to clean and also makes ice much easier to remove.

Application instructions

Do not dilute. Apply at a temperature above 5°C and not in direct sunlight. If you are applying indoors ensure that there is adequate ventilation. Ensure that the surface to be coated is entirely free from fats/oils. The effectiveness and life-span of the finished coating is highly dependent on the preparation of the surface. We recommend using a good glass polish prior to the application of g1. For application of g1 use the application pad to wipe g1 onto the surface of the glass ensuring complete and thorough coverage. We recommend two coats on windscreens (apply first coat, allow to dry for 10 minutes without buffing and then apply the second coat) and single on side and rear screens. Allow the coating to dry for 15 minutes. Once dried use another lint free cloth to apply the residue remover and then buff using a cotton towel type cloth (cotton is preferable to microfiber as the densely packed fibers of the microfiber cloth may remove too much of the partially cured coating from the surface) until you have removed all residue. We recommend buffing areas no bigger than quarter of a windscreen or half a side window at a time. On application it is recommended to thoroughly clean your wiper blades with IPA or window cleaner or if they are towards the end of their lifecycle to replace since heavily worn or soiled blades can judder on the surface.

Maintenance

The coating requires no special maintenance or screen wash. You can expect the coating to last for approximately 30,000miles regular driving. NB. You may get some wiper blade judder on first application. This normally diminishes completely in one to two weeks.
