Variation in the colour of EXOv4

Dear Most Valued Customer,

You may notice that the EXO you receive has a slight yellow colour to it when, normally, it is entirely clear.

This is due to a variation in one of the solvent carrier liquids used in the formula.

In order to allay any concern there may arise from this, we have carried out a full set of accelerated tests on this batch vs a previous batch that is entirely clear. As you will see from our results [here](#), there is no difference in performance. (NB these tests equate to approximately 3 years real time).

In addition to this, please note that all solvent carrier liquids fully evaporate from the surface after application so there will be no change to surface colour from the product. Furthermore, as shown in [this video](#), the yellowness in the liquid disappears once the product is opened. (NB during the course of the video the bottle is agitated twice causing the liquid to froth).

As ever, we are always available should you have any further concerns or questions.

Yours faithfully,

Rob Earle
